

Quality of Selection and use of Information

This week we will be looking and collecting different types of information to be used in your case study.

The following list will help you get full marks on this section of the case study!!!!

Making the best out of your case study:

1. You should use *different types of sources of information* that contain relevant information for your case study like books, websites, your own notes, etc.
2. Give *a list of sources used* and these should be **detailed** referring to, for example, book and page number and **full website address** as well as the **date and time** not just the homepage of the website.
3. It is important to *say how reliable you think each of your sources is*. This is particularly important for data from websites, which vary widely in the reliability and authority of the opinions expressed.

Scientific theory:

Collect information for the following scientific ideas.

- What is cloning?
- What are genes, DNA and chromosomes?
- How do you clone something?
- What cloning has been done already?
- Explain the 2 types of cloning (therapeutic and reproductive).
- What are 'natural' clones?

And any other information you come across about cloning.

Evidence:

- Why should cloning be allowed?
- Why should cloning not be allowed?
